

Mobile app, screen by screen

Every screen in the Flutter handset app, what sits on it, what it does in each state, and which of the four roles can reach it. Written for the UI designer — the build is complete, so this describes what exists today, not a proposal.

Flutter · Android + iOS

iPhone-only on iOS (no iPad layout)

English + Spanish

Light + dark, both shipped

Design width 390pt

4 roles

20 screens + 5 sheets

Who sees what

The bottom bar is built from the signed-in user, not a fixed list. Two things decide it: the `approve-leave` permission and whether anybody actually reports to the person. Both must be true for the Team tab to appear.

SCREEN	EMPLOYEE	MANAGER	HR	ADMIN
Clock	Yes	Yes	Yes	Empty state
History	Yes	Yes	Yes	Empty state
Leave	Yes	Yes	Yes	Empty state
Schedule	Yes	Yes	Yes	Empty state
Team	Hidden	Yes	Hidden	Hidden
Profile	Yes	Yes	Yes	Partial
My documents	Yes	Yes	Yes	No
Colleagues	Yes	Yes	Yes	No
Corrections	Raise + withdraw	Raise + withdraw	Raise + withdraw	No
Notifications	Yes	Yes	Yes	Yes

HR is deliberately desk-only. HR signs in and gets the employee screens — they clock in and book their own leave like anyone else — and nothing more. There is no HR approvals inbox in the app on purpose: everything HR actually does is employee records, the leave register, reports and the document vault, none of which is a phone job. Don't design one in.

Admin is a real edge case worth drawing. An administrator account has no employee record, so every employee screen answers "this account has no employee record, so there is nothing to clock". This state has no retry button — retrying cannot fix it — and it points at the web dashboard instead. Four screens show it.

Getting in

Five screens can stand in front of the app, and two of them replace it entirely rather than sitting on top.

Blocked? → Splash → Onboarding → Login → Lock → Home

Checked in that order on every launch. Each one is skipped when it doesn't apply.

Onboarding `onboarding_screen.dart`

FIRST LAUNCH ONLY

Four cards, shown once per handset, before the login form. Somebody being handed a work phone sees it; somebody signing back in after a shift never does.

ON SCREEN

- Four swipeable cards, each answering one real first-day question: **is the time it records mine or theirs, what happens on a site with no signal, where do I book a day off, will it tell me anything**
- Page dots
- Next / Get started button
- Skip

RULES

- No stock "Welcome!" illustrations — each card earns its place, because a decorative carousel trains people to skip past the one useful card
- Never shown again once finished, and never to a session that restored

Login `login_screen.dart`

EVERYONE

Email and password. The only way into the app.

ON SCREEN

- KEMP mark + subtitle
- **Email** field
- **Password** field with a show/hide eye toggle
- **Sign in** — spinner in place of the label while submitting
- **Forgot password?** text link
- Language switch is *not* here — it lives on Profile and survives sign-out

STATES

- **Wrong password** — "check your details"
- **Account disabled** — its own distinct message, not the same as a wrong password
- **Rate limited** — after 5 wrong attempts, refused with the wait remaining
- **Second factor** — admin/HR accounts with 2FA on are held at a code screen (web only today)
- **New device refused** — only when the company has device binding switched on

Forgot password `forgot_password_screen.dart`

EVERYONE

Asks the server to email a reset link. That is the app's whole part in it.

ON SCREEN

- Email field + **Send link**
- Confirmation state — deliberately says the same thing whether or not the address exists

RULES

- The emailed link opens the **web** reset page, not the app. The handset is often the thing the person has lost access to, so the reset has to work from a borrowed laptop
- No token-entry screen to design

Biometric lock `lock_screen.dart`

OPT-IN, PER HANDSET

Stands in front of the signed-in app on a shared work phone. Switched on by the person, from Profile.

ON SCREEN

- KEMP mark, lock message, **Unlock** button
- A way out — sign out — so the lock can never trap its own owner

RULES

- **Replaces the home shell, does not cover it.** Nothing of the signed-in app is readable behind it, in the app switcher included
- Re-engages after the phone has been put down for a grace period
- Only offered on a handset with a fingerprint or face actually enrolled

Blocked `blocked_screen.dart`

SERVER-TRIGGERED

Two conditions, one screen: the build is too old to keep talking to the server, or a maintenance window is open.

ON SCREEN

- **Update required** — message + store button
- **Maintenance** — the server's own message, shown in the language it was typed in

RULES

- Replaces *everything*, the login screen included — during a window there is nothing to sign in to
- Shown ahead of the splash: a verdict that arrives mid-launch is already final

The tab bar

Five tabs for most people, six for a manager. Tab order never changes; the Team tab is inserted before Profile when it applies.

1 · Clock `punch_screen.dart`

HOME TAB

ALL ROLES

The screen the app exists for. One big button, and enough around it that somebody can tell at a glance whether they are clocked in and for how long.

ON SCREEN

- **Notification bell** top right, with an unread count when there is one
- **Status card** — Clocked in / Not clocked in / On a break, the time it happened, and hours worked today, ticking live between refreshes
- **The button** — Check in or Check out, ~120pt tall, icon over label. Navy when clocking in, deep navy when clocking out, so the two states are told apart by shade as well as word
- **Geofence line** — "Clock in within 100 m of Head Office", shown before anybody taps, only where a fence applies
- **Break button** — Start / End break, only while on the clock
- **Break policy note** — one line saying what the break costs: "A 30-minute break comes off your hours", or that it is paid, or that it is a minimum
- **Day notes** — day off, company holiday, booked leave
- **Today's punches** — a list of in / out / break start / break end with times and a "late" flag

STATES

- **Cooldown** — button greyed with a line explaining why, rather than a tap that fails
- **Queued punches** — "2 punches waiting to send", with a retry. Shown whenever anything is waiting, not only while offline
- **Offline, no copy of today** — a distinct card that deliberately says *nothing* about whether the person is on the clock, because the handset does not know. The button still queues a punch
- **Offline, saved copy** — banner "showing the copy saved today at 14:02"; the worked-hours figure stops ticking
- **Outside the fence** — refused locally, naming the office and the distance
- **Double tap** — reads as success, not as an error
- **No employee record** — admin empty state, no retry

2 · History `history_screen.dart`

ALL ROLES

Two shapes of the same data. The list answers "what happened recently"; the calendar answers "which days did I miss", which is the one people bring a dispute to.

ON SCREEN

- **List / calendar toggle**
- **Month bar** with back/forward arrows (calendar view)
- **Score and streak** — sits above the totals, because it is the question people open the screen with. Never a bare number: a line underneath says what it is made of
- **Five counts** — present, late, absent, leave, day off
- **Day rows** — date, in/out times, hours, status
- **Request a correction** in the app bar

RULES

- **A status is never colour alone.** Each day carries a tone, a shape that means the same thing without it, and a word a screen reader says
- The month is never built from the phone's clock — the server names the day first
- Zero score and no score at all are different answers and read differently

3 · Leave `leave_screen.dart`

ALL ROLES

What is left, what has been asked for, and the form to ask for more.

ON SCREEN

- **Balance cards** — one per leave type: entitlement, taken, remaining, carried forward
- **Request cards** — dates, type, day count, status (pending / approved / rejected / cancelled), reason, and who decided it
- **Cancel** on a request that has not been decided
- **Apply** — extended floating button

APPLY SHEET

- Leave type picker, start and end date, reason
- **Half day** switch, and when on, an AM / PM segmented control
- Optional attachment
- **No day count is shown while filling it in.** Weekends and company holidays inside the range are free, so only the server knows what it costs — the response says what it actually came to

4 · Schedule `schedule_screen.dart`

ALL ROLES

The next fortnight, oldest first — a schedule is read forwards.

ON SCREEN

- One row per day: date, shift name, start and end, office
- Day off, holiday and booked-leave days marked in the run
- Today marked

RULES

- **Published days only.** A roster still being planned falls back to the standing shift as though it did not exist — staff watching draft days move around is the problem publishing exists to prevent

5 · Team `approvals_screen.dart`

MANAGER ONLY

Manager mode, as four sub-tabs under one app bar. Every endpoint behind it is scoped to the manager's own direct reports.

FOUR SUB-TABS

- **Approvals** — pending requests from direct reports, each with approve and reject, and a reason field on reject
- **In today** — who is on the clock right now, who is late, who has not arrived
- **Roster** — the week ahead per person, published days only
- **Leave** — who is off this month, laid out by date rather than by person, because the question is "can I let a second person go that week"

RULES

- The tab needs the `approve-leave` permission **and** at least one direct report. HR holds the permission and has no reports, which is why HR does not get it
- A manager with nobody reporting gets no tab at all, rather than four permanently empty screens
- Approval is step one of two — HR confirms on the web. There is no correction-approval here for anyone

Who the person is, plus every setting and every way out. The densest screen in the app and the one most in need of grouping.

ON SCREEN

- **Identity** — photo, name, employee code
- **Work** — department, job title, office, work mode
- **Account** — company, timezone, roles
- **My documents** →
- **Colleagues** →
- **Edit contact** — phone and email
- **Home & emergency contact** — address and next of kin
- **Change password**
- **Language** — each option written in its own language, so "Español" is findable by somebody who cannot read the current one
- **Biometric lock** switch
- **Sign out · Sign out everywhere** — the lost-phone action, confirmed separately
- **Privacy policy · Delete my account** — both open the server's web pages

RULES

- Language and the biometric switch describe **this handset**, not the account, and both survive a sign-out — clearing the language would put the login form back into a language the person standing there cannot read
- The biometric row is drawn only on a phone with something enrolled; not present-but-disabled, which would send somebody hunting for a setting that is not the app's to change
- For an admin, the work block is replaced by the no-employee-record message; the settings still work

Pushed screens and sheets

Reached from a tab rather than given one of their own — each is opened occasionally, and the bottom bar is already at six for a manager.

Notifications

notifications_screen.dart · from the Clock bell

ALL ROLES

The history behind the push banners. Until it existed, a notification that arrived while the phone was in a locker was simply gone.

ON SCREEN

- Rows: title, body, relative time, unread dot
- **Open ...** button on rows that lead somewhere, naming the destination tab
- Mark all read

RULES

- **Reading and going somewhere are separate gestures**, unlike the web. On a phone the list *is* the destination for most of these — a leave decision says what was decided without going anywhere
- Four things can route: clock, leave, schedule, approvals

Corrections

regularisations_screen.dart · from History

ALL ROLES

Asking for the attendance record to be fixed when a punch is wrong.

ON SCREEN

- List of requests raised, with status
- Raise form: the day, what it should say, why
- Withdraw on a pending one

RULES

- **Raising and withdrawing only — there is no decide button here for anybody, manager included.** Approving one voids a punch and writes a replacement, which is HR's alone and happens on the web

My documents

documents_screen.dart · from Profile

ALL ROLES

The employee's own file — contract, ID, certificates.

ON SCREEN

- Rows: document name, type, expiry where it has one, download
- Expiring-soon and expired marked

RULES

- **Read-only, and so there is no add button to explain the absence of.** Filing is HR's job and the API offers no upload

The only screen in the app about other people, and so the plainest.

ON SCREEN

- Search
- Rows: photo, name, job title, office
- Call / email, *only* where the company has switched contact details on

RULES

- **Contact details are off by default.** There is one phone column on an employee record, and for a workforce with no desk lines it holds personal mobiles
- No date of birth, address, salary or reporting line — a colleague cannot see more than a manager

Outside the app

Two surfaces the designer owns that are not screens.

Launcher quick action

Long-press the app icon

ALL ROLES

One item on the long-press menu — **Check in** or **Check out**, whichever the day calls for. Tapping it opens the app on Clock and makes the punch. Two presses from a locked home screen.

RULES

- **One item, never two.** The server decides the direction of a punch, so a menu offering both would let somebody pick the one that is not true and still succeed
- No custom icon — it falls back to the KEMP mark, which is already the right picture

RULES

- Comes off the launcher on sign-out: on a shared handset a "Check out" left behind is one tap from clocking out the next person
- The label is translated; the identifier behind it is not

Push notifications

OS banner + in-app banner

ALL ROLES

Five things can arrive: a leave decision, a request needing a manager, a roster change, a missing check-out reminder, and an announcement.

ON SCREEN

- OS banner when the app is closed or backgrounded
- **In-app banner** when it arrives with the app open — Android shows nothing of its own in that state, so the app decides

RULES

- Written in the recipient's language, not the language of whoever caused it
- A tap lands on the right tab, not just "open"
- Silent until the client's Firebase project exists — everything else works without it

Rules that apply to every screen

These are already enforced by an automated accessibility and translation check, so a design that breaks them will fail the build rather than ship.

PALETTE — BOTH THEMES ARE SHIPPED

 KEMP navy #033C93 · light primary	 Navy deep #01174B · second control	 KEMP gold #FDD810 · dark primary	 Gold deep #D4B200 · second control
 Present #186B48 / #2AB57B	 Late #7E5709 / #CE9730	 Absent #A13E36 / #D78D87	 Leave #33609D / #7FA4D6

Gold is never text on a light surface. On white it measures 1.4:1, which fails even the 3:1 asked of a graphic. It is the dark-mode primary and the mark on a dark ground — nothing else. Navy is the mirror image: on the dark scaffold it is 1.4:1, so the brand colour swaps with the theme rather than staying put.

NON-NEGOTIABLES

TYPE AND LAYOUT

- **No fixed heights on anything holding text.** Every screen is tested at 2× the OS font size, and a fixed box clips — this already shipped a bug on the punch button, the one control the whole app exists for. Use minimums
- **Spanish runs 20–30% longer than English.** Every label needs room to wrap; "Fichar entrada" against "Check in"
- Bottom sheets must clear the navigation bar with the keyboard down — the submit button lives at the end of the sheet

COLOUR AND STATE

- **4.5:1 minimum on every surface, both themes.** Measured automatically on every screen
- **Status is never colour alone** — tone, plus a shape, plus a word
- Every screen needs four states drawn, not one: loading, empty, error, and offline-from-saved-copy
- A retry button is a claim that retrying can work. The no-employee-record state has none

Describes the shipped build as of 15 September 2026 — 290 widget tests, analyzer clean. Source of truth is `Feature-List_Web-and-App.md` Part B in the repository; where this page and the code disagree, the code is right.
